Complete Fire Protection

Fire safety has many different aspects. Detection, warning and evacuation are the main and most critical components of the fire prevention. Spika voice evacuation system is specially designed to complete Teletek's range of life safety systems, by adding the voice evacuation features and combine them with our fire alarm and detection systems.

SPIKA - Voice Evacuation and Public Announcement System

The Spika series of compact control panels includes 3 integrated voice evacuation panels for emergency systems, specifically designed for wall mounting. The system is certified in accordance with the EN 54-16 and EN 54-4 standards.

Depending on the model, these control panels can manage between 2 and 6 speaker zones, with A/B structure, which can be controlled via 1 or 2 amplifiers. All panels have maximum power of 500W, which can be distributed amongst the different zones. That gives us the possibility of sending voice messages in different areas of the building.

Connection to fire alarm panel

The cooperation between the voice evacuation and the fire alarm panels is crucial for the reliability of the systems. Every Spika panel supports a serial connection with iRIS4, iRIS8 and Simpo fire alarm panels. The serial link assures that the fire alarm panel will send all the information and will trigger the voice evacuation, in case of a fire condition.

Spika panels also support certified input/output connection to any fire alarm panel.

Public announcement and background music

Spika system is not only helpful in case of an emergency, but it also offers a lot of useful features that are needed on a daily basis, such as: making public announcements in different areas of the building or even playing background music. Those functionalities are used in many types of public buildings, such as: business centers, hotels, hospitals and many more.
